

ANGULAR PROJECT STRUCTURE

codewithrutu_09

✓ What Gets Created?

When you create an Angular app using CLI:

```
bash
ng new my-app
```

You get a folder structure like:

```
pgsql
my-app/
├── node_modules/
├── src/
│   ├── app/
│   ├── assets/
│   ├── environments/
│   ├── index.html
│   ├── main.ts
│   └── styles.css
├── angular.json
├── package.json
└── tsconfig.json
```

✓ **/src/app/ – Core Application Code**

Your Angular app logic lives here.

📌 Contains:

- 1. Components**
- 2. Services**
- 3. Modules**
- 4. Routing config**

✓ **Organize by feature modules as the app grows.**

✓ **/assets/ and /environments/**

assets/ – Public static files

1. Images
2. JSON data
3. Fonts
4. Favicons

environments/ – Configuration per build environment

1. **environment.ts (dev)**
2. **environment.prod.ts (production)**

```
app.component.html  
  
import { environment } from '../environments/environment';
```

✓ Root Config Files Explained

1. **angular.json** – Angular CLI config
(build options, file paths, etc.)
2. **package.json** – Project
dependencies and scripts
3. **tsconfig.json** – TypeScript
compiler settings
4. **.browserslistrc** – Browser support
list
5. **.gitignore** – Files Git should ignore

📌 Edit these carefully – they impact
how your app builds & runs.

✓ Entry Points of Angular Project

1. **index.html** : The single HTML shell Angular injects into.
2. **main.ts** : Bootstrap file that launches your Angular app :

```
app.component.ts  
  
platformBrowserDynamic().bootstrapModule(AppModule)
```

🎯 You rarely modify these, but they're essential to Angular's startup process.

✓ Suggested Folder Best Practices

As your project scales, consider structuring like

```
app.component.ts

app/
├── core/           → singleton services, guards
├── shared/         → reusable components, pipes
├── features/       → individual feature modules
├── app-routing.module.ts
└── app.module.ts
```

✓ Helps with maintainability, reusability, and scalability
