

DIRECTIVE **IN ANGULAR**

codewithrutu_09

✓ What Are Angular Directives?

A directive is a **class** that can **modify the DOM or behavior** of an element.

🧠 Think of them as instructions in your HTML:

1. Manipulate layout
2. Listen to events
3. Add or remove elements dynamically

Directives are one of the core building blocks of Angular. They let you control **how your app behaves or looks** — directly in the template.

✓ Types of Directives in Angular

Angular has **three types** of directives:

1. Component Directive

🎨 Technically a directive with a template

2. Structural Directive

📦 Changes the DOM layout

Examples: *ngIf, *ngFor, *ngSwitch

3. Attribute Directive

🎨 Alters the appearance or behavior of elements

Examples: ngClass, ngStyle, custom highlight directives

✓ Structural Directive Example – *ngIf

```
<p *ngIf="isLoggedIn">Welcome back!</p>
```

↻ *ngIf removes or adds the element to the DOM based on condition.

```
<li *ngFor="let item of items">{{ item }}</li>
```

↻ Renders DOM elements dynamically based on data.

✓ Structural Directive Example – ngStyle & ngClass

```
<p [ngStyle]="{ color: isError ? 'red' : 'green' }">Status</p>
```

```
<div [ngClass]="{ 'active': isActive }"></div>
```

↻ Attribute directives don't change layout, but they change appearance or add behavior.

✓ Creating a Custom Directive

bash

```
ng generate directive highlight
```

ap.component.ts

```
@Directive({  
  selector: '[appHighlight]'  
})  
export class HighlightDirective {  
  constructor(el: ElementRef) {  
    el.nativeElement.style.background = 'yellow';  
  }  
}
```

app.component.html

```
<p appHighlight>Highlight me!</p>
```

Use Cases for Directives

- **Show/hide elements dynamically**
- **Highlight fields on validation**
- **Toggle classes/styles based on logic**
- **Build dropdowns, tooltips, accordions**
- **Create reusable visual behaviors**
- **Combine with HostBinding / HostListener for better control**
- **Use structural directives for layout, attribute for style/behavior**
