

EVENT BINDING IN ANGULAR

codewithrutu_09

✓ What is Event Binding?

Event Binding allows your Angular application to **listen to user actions** and respond using **component methods**.

↻ Common user events:

1. click
2. keyup
3. mouseenter
4. submit

Property Binding Syntax

app.component.html

```
<button (click)="handleClick()">Click Me</button>
```

Syntax Breakdown

Event binding uses parentheses ()

```
● ● ● app.component.html  
  
(eventName)="componentMethod( )"
```

Example :

```
● ● ● app.component.html  
  
<input (keyup)="onKeyUp( )" />
```

```
● ● ● app.component.ts  
  
onKeyUp( ) {  
    console.log( 'Key pressed' );  
}
```

Passing Event Data

Angular allows you to access the native DOM event object using `$event`.

app.component.html

```
<input (keyup)="onKeyUp( $event )" />
```

app.component.ts

```
onKeyUp(event: KeyboardEvent) {  
  console.log(event.target.value);  
}
```

 `$event` gives you access to everything about the user action — like which key was pressed.

Binding with Parameters

You can combine component data and event data.

app.component.html

```
<button (click)="addToCart(product)">Add</button>
```

app.component.ts

```
addToCart(product: Product) {  
  this.cart.push(product);  
}
```

🛒 This is especially useful in e-commerce, dashboards, and CRUD apps.

Event Binding + Template Reference Variables

Using #ref to get values directly from the DOM:

app.component.html

```
<input #nameInput />
<button (click)="greet(nameInput.value)">Greet</button>
```

app.component.ts

```
greet(name: string) {
  alert(`Hello, ${name}`);
}
```

🎉 No need to bind to ngModel for simple cases like this!

Combining Event Binding with Other Angular Features

Angular encourages **composability**.

1. Event binding (**click**)
2. Property binding [**disabled**]
3. Conditional logic ***ngIf**

```
app.component.html

<button
  (click)="submit()"
  [disabled]="isLoading">
  Submit
</button>
```

🎯 This improves user experience and code readability.
