

TEMPLATE FORM IN ANGULAR

codewithrutu_09

✓ **What is Template Forms?**

✚ **Template-driven forms are forms created primarily in the HTML template using Angular directives.**

✓ **Ideal for:**

- **Simple to medium-complexity forms**
- **Developers who prefer template-based logic**
- **Quick prototyping**

Built on Angular's FormsModule.

Build forms faster with two-way data binding and simple directives in Angular.

✓ Setup — Enable FormsModule

To use template forms:

◆ Import FormsModule in your module:

```
app.component.ts

import { FormsModule } from '@angular/forms';

@NgModule({
  imports: [FormsModule]
})
export class AppModule {}
```

No ReactiveFormsModule needed for this form type.

✓ Basic Example

```
app.component.html

<form #userForm="ngForm" (ngSubmit)="submitForm(userForm)">
  <input name="username" ngModel required />
  <button type="submit">Submit</button>
</form>
```

- ◆ ngModel binds input value
- ◆ #userForm="ngForm" gives access to form state
- ◆ (ngSubmit) handles submission

✓ Two-Way Binding with [(ngModel)]

Bind input to component variable:

app.component.html

```
<input [(ngModel)]="user.name" name="name" />
```

Automatically keeps your form input
and model in sync

Works great with small models

✓ Validation with Template Forms

Angular provides built-in validators via attributes:

```
app.component.html  
  
<input name="email" ngModel required email />  
<div *ngIf="email.invalid && email.touched">Invalid email</div>
```

✓ Validators:

- required
- minlength, maxlength
- pattern
- email

Use template reference variables like `#email="ngModel"` to access field state

✓ Form State & CSS Classes

Angular automatically applies classes based on state:

🧪 Useful classes:

- `ng-valid` / `ng-invalid`
- `ng-touched` / `ng-untouched`
- `ng-dirty` / `ng-pristine`

app.component.html

```
<input ngModel name="phone" required />  
<!-- Angular adds dynamic classes -->
```

💡 Use them for styling error states or UX improvements.

✓ Submit & Access Form Values

Submit the form:

```
app.component.html

<form #formRef="ngForm" (ngSubmit)="onSubmit(formRef)">
  <input name="email" ngModel />
</form>
```

In component:

```
app.component.ts

onSubmit(form: NgForm) {
  console.log(form.value); // { email: "user@example.com" }
}
```

Key Takeaways

- **Template-driven forms are simple and quick**
- **Use FormsModule and ngModel for binding**
- **Supports validation, CSS state classes, and submission tracking**
- **Perfect for lightweight forms or quick builds**
