Introduction

Angular is a web framework that empowers developers to build fast, reliable applications. **Angular** provides a broad suite of tools, APIs, and libraries to simplify and streamline your development workflow.

Here are

Features that power your development

Organize codebase with Dependency Injection

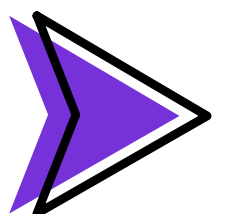

Angular components make it easy to split your code into well-encapsulated parts.

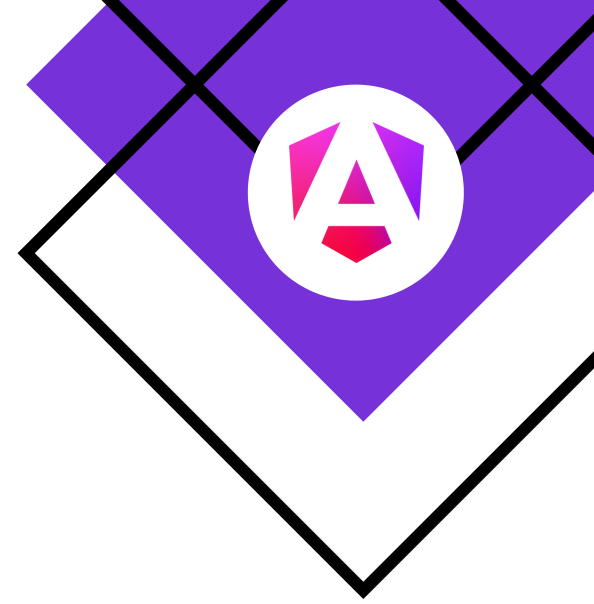

The versatile dependency injection helps you keep your code modular, loosely-coupled, and testable

Works together with first-party modules

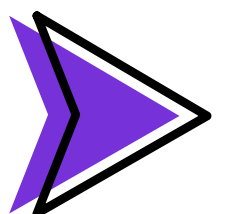

Angular's router module provides a feature-rich navigation toolkit, including support for route guards, and much more.

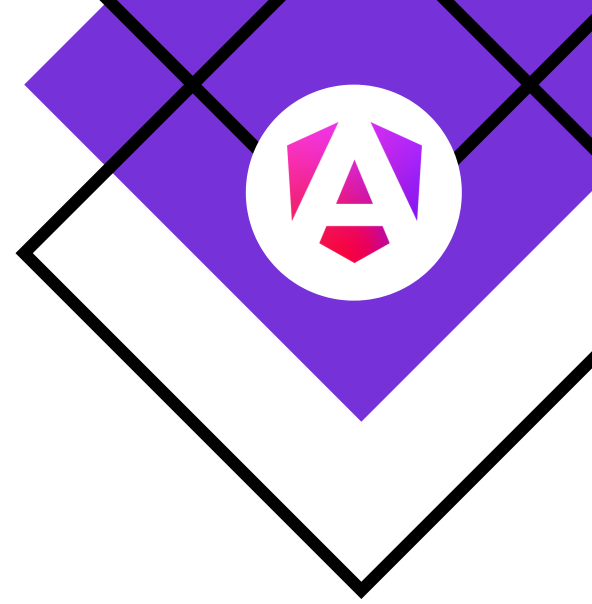

Angular's forms module provides a standardized system for form participation and validation.

Effortlessly build, serve, test, deploy with Angular CLI

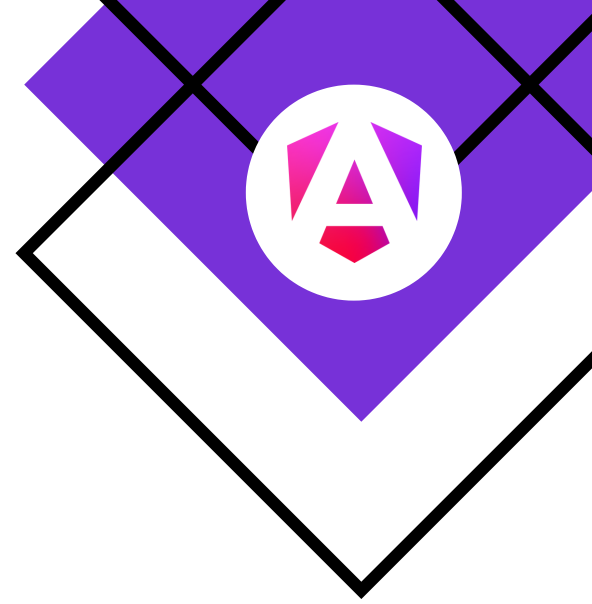

Angular CLI gets your project running in under a minute with the commands you need to grow into a deployed production application.

Visually with the Angular DevTools browser extension

Angular DevTools helps debug and analyze your app, including a component tree inspector, dependency injection tree view, and custom performance profiling flame chart.
