Angular v19 Installation

Let's swipe now

Ardianto Nugroho
Fullstack Developer

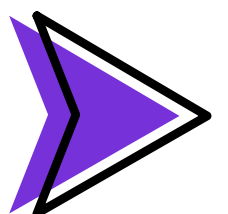

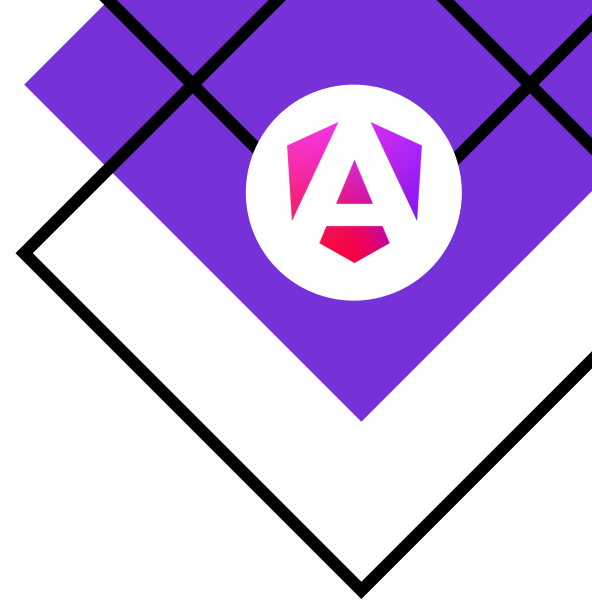

Prerequisites

- ◆ Node Js - v18.19.1 or newer
- ◆ Text editor - Recommended Visual Studio Code
- ◆ Terminal - For running Angular CLI commands
- ◆ Development Tool - To improve your development workflow, recommend the Angular Language Service

Instructions

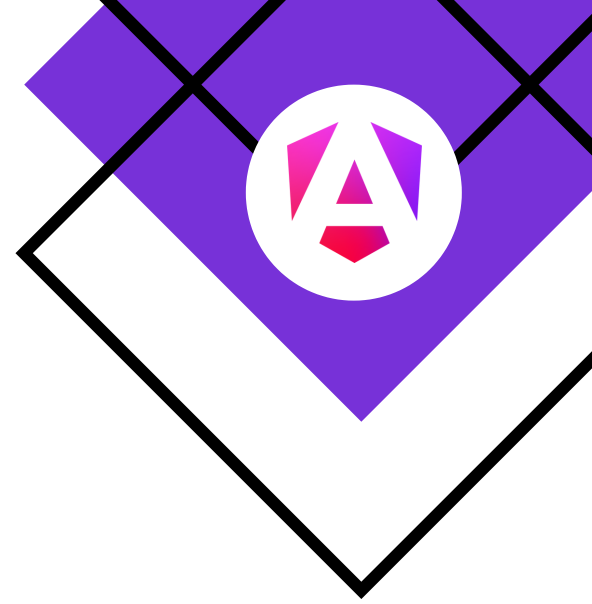

Follow the next guide to setting up a local **Angular project**

Make sure you have met the previous requirements. So, let's get started...

Ardianto Nugroho
Fullstack Developer

Install Angular CLI

Here example using NPM for package manager. But, you can adjust it to your own.

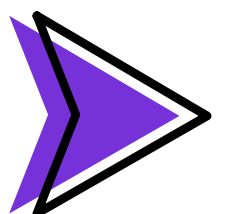

NPM

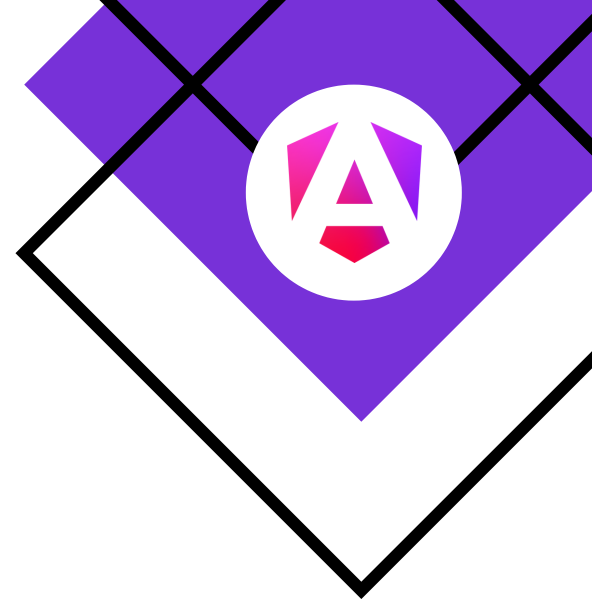

```
npm install -g @angular/cli  
// it will install the latest Angular CLI
```

Check Installed Angular CLI

You can verify that it is actually installed with the following command.

Terminal

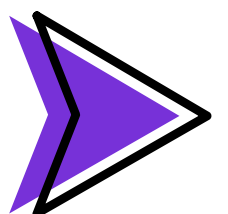

```
ng version
```

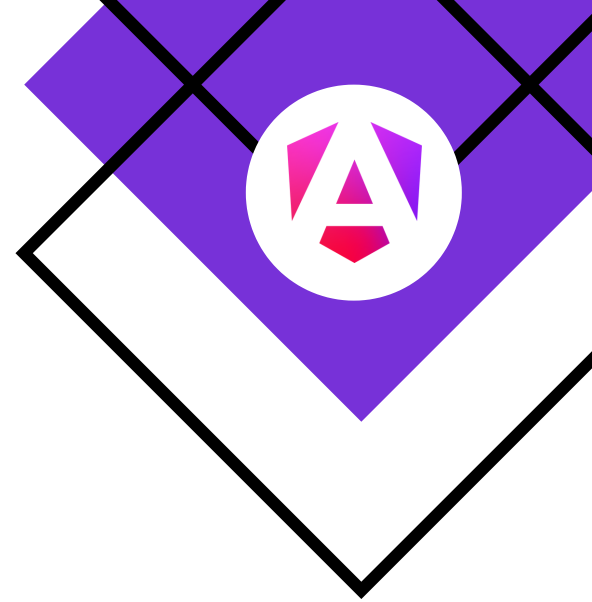

The Angular CLI logo, which consists of the words "Angular" and "CLI" in a stylized, outlined font.

```
Angular CLI: 19.0.5  
Node: 20.15.1
```

Create a New Project

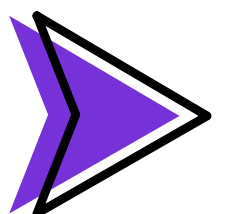

Running command **ng new** with following the project name. In here we'll using the example project name of **my-first-angular-app**.

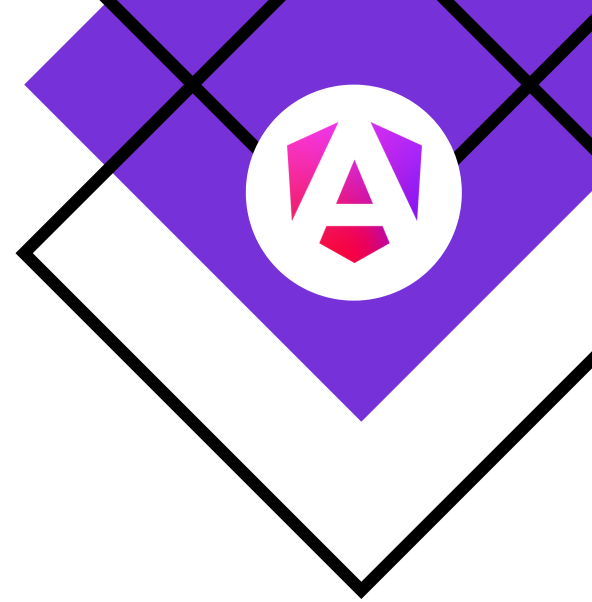

Terminal

```
ng new my-first-angular-app  
  
// it will show some configuration for your  
project. Just move the arrow and select which your  
desire. If you don't have any preference, just hit  
enter key to take the default configuration.
```

Success Installed

Terminal

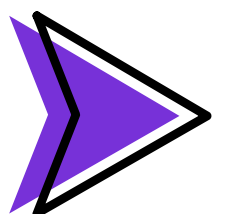

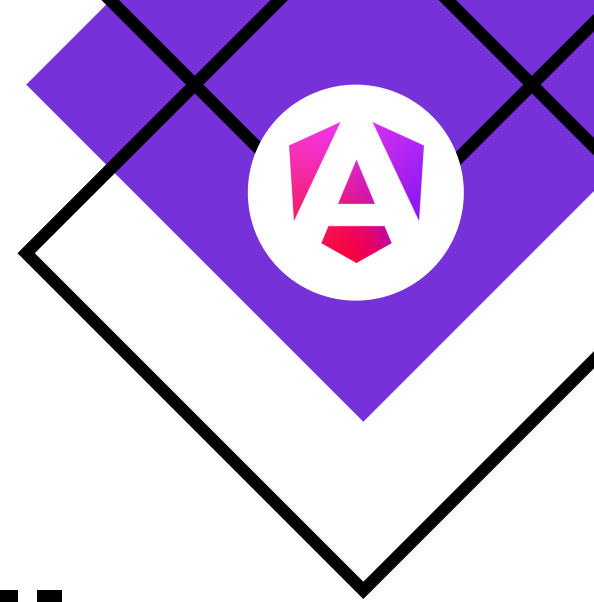

```
✓ Packages installed successfully.  
Successfully initialized git.
```

At this point, you're now ready to run your project locally!

Running Project Locally

Terminal

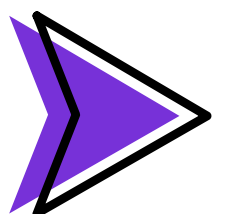

```
cd my-first-angular-app
```

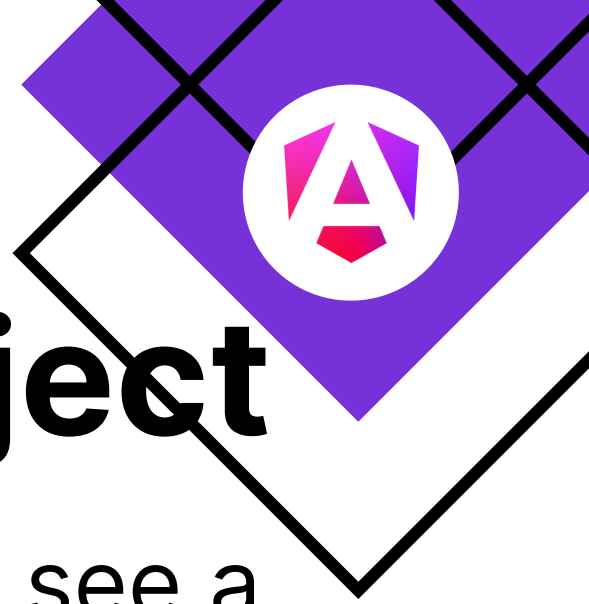

```
// All of your dependencies should be  
installed at this point. Verify node_modules  
folder is exist in the project. so you can  
start the project with the command:
```

```
npm start
```

Success Running Project

If everything is successful, you should see a similar confirmation message in your terminal.

Terminal

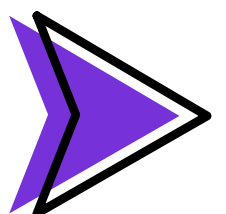

```
Watch mode enabled. Watching for file changes  
NOTE: Raw file sizes do not reflect development  
server per-request transformations.  
→ Local: http://localhost:4200/  
→ press h + enter to show help
```

Visit the path <http://localhost:4200> to see your application.
