

7 Major Angular Updates I Witnessed Since v13

If you're starting with Angular now, here's what you missed — and what matters most.

Sreeram Saikumar

Angular Developer

 /sreeramsaikumar

Angular 13 (November 2021)

- **Dropped View Engine**, fully embracing Ivy renderer for production apps, speeding up rendering and builds.
- **Removed Internet Explorer 11 support.**
- **Build & library updates:** Introduced ESbuild for CSS/sourcemaps, persistent build cache, and updated the Angular Package Format to ES2020 — removing legacy View Engine support
- **Form API enhancements:** New strongly typed FormControlStatus and utility methods like addValidators, hasValidator, etc.

 /sreeramsaikumar

Angular14 (June 2022)

- **Strictly typed reactive forms**, with generics and migration assistance.
- **Standalone components (experimental)** — allowing apps to skip NgModule and declare components, directives, pipes standalone.
- **Router improvements:** Static titles in routes, TitleStrategy, improved strict types, and route-level providers.
- **Template diagnostics:** Compiler now issues warnings for template mistakes and unused operators.

 /sreeramsaikumar

Angular 15 (November 2022)

- **Standalone APIs move to stable:** standalone components, directives, pipes, and directive composition API now production-ready.
- Improved Angular Material/CDK support for standalone usage and accessibility enhancements .

 /sreeramsaikumar

Angular16 (May 2023)

- **Signals** introduced as a core reactivity model.
- **Partial hydration for SSR:** Angular Universal can now progressively hydrate parts of the page.
- **Experimental Jest support**, and **esbuild-based dev server** for faster local builds.

 /sreeramsaikumar

Angular 17 (November 2023)

- **Signals API matured**, enabling reactive state management across apps.
- New **template control-flow syntax**: Using @if, @for, @switch instead of *ngIf, *ngFor, *ngSwitch.
- **Standalone as default**: CLI generates standalone components by default, bypassing NgModules entirely

 /sreeramsaikumar

Angular 18 (May 2024)

- **Zoneless change detection (experimental):** Apps can opt out of Zone.js, giving more manual control and potentially faster update cycles.
- **Further SSR improvements**, including enhanced debugging and default content support for `<ng-content>`

 /sreeramsaikumar

Angular19 (November 2024)

- **Standalone components, pipes, and directives become default** across projects.
- **Incremental hydration (SSR)** becomes stable — launching faster page interactions and better performance.
- **Introduced Resource and HttpResource APIs** (experimental) for more powerful, signal-based data loading.
- Enhanced **HMR for CSS/templates**, speeding up development workflows

 /sreeramsaikumar

Angular 20 (May 2025 – current)

- **Signals APIs officially stable:** effect, toSignal, linkedSignal, toObservable, afterEveryRender, pendingUntilEvent, among others – now reliable and production-ready.
- **Control-flow syntax deprecation:** The legacy *ngIf, *ngFor, *ngSwitch are now formally deprecated in favor of the @if/@for/@switch syntax.
- **Zoneless Angular enters developer preview:** Full opt-in support via CLI flags and providers.
- **Incremental hydration and route-level render-mode controls** now stabilized.
- **Timeline debugging in Chrome DevTools:** Angular app-specific profiling integrated directly into DevTools UI.

 /sreeramsaikumar

Angular20 Continuous...

- **Template hot module replacement (HMR)** is now enabled by default — update UI without losing state.
- **Host binding enhancements**, support for untagged and tagged JavaScript template literals directly in templates.
- **Early support for Vitest** replacing Karma in testing setups, with testing utilities moving to Testbed.inject and replacing flushEffects with tick().
- **Naming updates:** CLI no longer appends suffixes like Component, Service by default for less boilerplate.
- **Experimental Resource APIs** and **HttpResource** simplify handling streaming data and reactive HTTP logic.
- **Auto-generated Content Security Policy (CSP)** in production builds to enhance security
